

One photograph. Three moods.

Your quick guide to Colour Moods presets

Lightroom Classic on Mac or Windows. Install once, then explore.

1 Install your presets

Unzip your download, then open a photograph in **Develop**.

In the left **Presets** panel, click the **plus button** and choose **Import Presets**. Select all three **.xmp** files and click **Import**. Leave out the readme file.

Click the plus button shown above.

2 Choose your mood

First, adjust **Exposure** and **White Balance** to suit your photo. Open the **Michael Choong - Colour Moods** group, then click a preset.

01 Warm and Welcoming

Peach gold light with gently cool shadows.

02 Cool and Quiet

Blue tones with a little warmth in the light.

03 Muted and Nostalgic

Dusty warmth, softer contrast and less colour.

Click another preset to switch moods. There is no need to reset between them.

3 Make it your own

Start with **Amount 100**. If the effect feels too strong, move the slider left. Try **50** for a gentler look, then adjust by eye.

Finish by adjusting brightness or warmth. Choose the mood that feels right to you.

The Amount slider sits above Presets.

These presets change Colour Grading, Contrast and Saturation. Exposure and white balance stay as you set them. Results vary with your original photo.
